5.0 GIB® PERFORMANCE SYSTEMS

The GIB® Performance Systems section covers installation of GIB EzyBrace® and GIB Aqualine® Wet Area Systems. For other systems including GIB Noise Control®, GIB® Fire Rated, GIB® Tough and GIB® Intertenancy Barrier Systems refer to the appropriate GIB® systems literature.

5.1 GIB® BRACING SYSTEMS

This section covers the installation of GIB EzyBrace® Systems to timber framing to NZS 3604:2011. Full design details can be found in the GIB EzyBrace® Systems literature.

Bracing of steel framed walls is by specific design. For assistance refer to the document GIB EzyBrace® for Light Steel Frame Systems available from gib.co.nz or nashnz.org.nz.

5.1.2 System Specifications

**GS2-NOM**

1. 10mm or 13mm GIB® Standard plasterboard fixed to each side of the wall framing
2. Corner fastening pattern applies (see p. 65)
3. 32 x 6g GIB® Grabber® screws or GIB® Grabber® Dual Thread screws at 300mm to perimeter
4. Panel hold downs not required
5. Centre of the sheet may be fixed with adhesive or fastenings at 300mm
6. Joints and fastener heads must be stopped
7. GIB® tape must be used in joints
8. Sheets may be fixed horizontally or vertically

**GS1-N**

1. Any 10mm or 13mm GIB® plasterboard to one side of the wall only
2. Corner fastening pattern applies (see p. 65)
3. 32 x 6g GIB® Grabber® screws or GIB® Grabber® Dual Thread screws at 150mm to perimeter
4. Centre of the sheet may be fixed with adhesive or fastenings at 300mm
5. Panel hold downs not required
6. Joints and fastener heads must be stopped
7. GIB® tape must be used in joints
8. Sheets may be fixed horizontally or vertically

**GS2-N**

1. Any 10mm or 13mm GIB® plasterboard to both sides of the wall. Both sides fixed as bracing elements
2. Corner fastening pattern applies (see p. 65)
3. 32 x 6g GIB® Grabber® screws or GIB® Grabber® Dual Thread screws at 150mm to perimeter
4. Centre of the sheet may be fixed with adhesive or fastenings at 300mm
5. Panel hold downs not required
6. Joints and fastener heads must be stopped
7. GIB® tape must be used in joints
8. Sheets may be fixed horizontally or vertically

**GSP-H**

1. Any 10mm or 13mm GIB® plasterboard to one side of the wall
2. 7mm structural plywood to the other side
3. Corner fastening pattern applies (see p. 65)
4. 32 x 6g GIB® Grabber® screws or GIB® Grabber® Dual Thread screws at 150mm to perimeter (plasterboard side) 50 x 2.8mm FH nails at 150mm to perimeter. Corner fastening pattern not applicable to plywood side
5. Panel hold downs required
6. Centre of the sheet may be fixed with adhesive or fastenings at 300mm
7. Joints and fastener heads must be stopped
8. GIB® tape must be used in joints
9. Sheets may be fixed horizontally or vertically

### 5.1.4 Panel Hold-Down Details

**GIB HandiBrac® – Recommended Method**

Developed in conjunction with MiTek™ NZ, the GIB HandiBrac® has been designed and tested for use as a hold-down in GIB® BL and GSP bracing elements.

— The GIB HandiBrac® registered design provides for quick and easy installation
— The GIB HandiBrac® provides a flush surface for the wall linings because it is fitted inside the framing. There is no need to check into the framing as recommended with conventional straps
— The GIB HandiBrac® is suitable for both new and retrofit construction
— The design also allows for installation and inspection at any stage prior to fitting internal linings

#### Concrete Floors

- **External Walls**
  - Position GIB HandiBrac® as close as practicable to the internal edge of the bottom plate

- **Internal Walls**
  - Position GIB HandiBrac® at the stud / plate junction

#### Timber Floors

- **External Walls**
  - Position GIB HandiBrac® in the centre of the perimeter boundary joist

- **Internal Walls**
  - Position GIB HandiBrac® in the centre of floor joist or full depth solid block

**Hold-Down Fastener Requirements**

- A mechanical fastening with a minimum characteristic uplift capacity of 15kN or use supplied BT 10/140 screw bolt in GIB HandiBrac® pack.
- 12 x 150mm galvanised coach screw or use supplied BT 10/140 screw bolt in GIB HandiBrac® pack.
Bracing Strap Installation

Care needs to be taken with the installation of the bracing strap. It should be checked in to be flush with the face of the stud providing a flat substrate for the plasterboard. It should be positioned in such a way that the important corner fastenings of the bracing element are not affected by it. Keeping the strap to the edge of the end stud as shown will allow the important corner fastenings to be installed without having to penetrate the bracing strap.

Concrete Floors

400 x 25 x 0.9mm galvanised strap to pass under the plate and up the other side of the stud. Six 30 x 2.5 flat head galvanised nails to each side of the stud. Three 30 x 2.5 flat head galvanised nails to each side of the plate. Hold down bolt with 50 x 50 x 3mm washer to be fitted within 80mm of the edge of the element.

<table>

<td><img src="image3.png" alt="Diagram" /></td>
<td><img src="image4.png" alt="Diagram" /></td>
</tr>
</tbody>
</table>

Timber Floors

2/300 x 25 x 0.9mm galvanised straps with six 30 x 2.5mm flat head galvanised nails to each stud and into the floor joist and three nails to the plate. Block to nog fixed with 3/100 x 3.75mm nails to stud.

Hold-Down Fastener Requirements

Concrete Floors

A mechanical fastening with a minimum characteristic uplift capacity of 15kN fitted with a 50 x 50 x 3mm square washer within 80mm of the ends of the bracing element.

Timber Floors

12 x 150mm galvanised coach screw fitted with a 50 x 50 x 3mm square washer within 80mm of the ends of the bracing element.
5.1.5 GIB EzyBrace® Corner Fastener Pattern

Corner Fastener Pattern for ALL 4 CORNERS OF GIB® Bracing Elements (excluding GS2-NOM).

— All four corners of a GIB® plasterboard bracing element must be fastened as per the fastening patterns shown below

— Bracing element perimeter is then fastened at 150mm centres, or for GS2-NOM 300mm centres

— Fasteners must be no closer than 12mm from the paper enclosed edge and no closer than 18mm from sheet ends or cut edges of sheets
5.1.6 Permitted GIB EzyBrace® Plasterboard Substitutions
Refer to p. 14 for GIB® plasterboard substitutions in GIB EzyBrace® systems

5.1.7 General Installation Details
— Timber framing to comply with NZS 3604:2011
— Minimum stud dimensions:
  — External walls – 90 x 35mm
  — Internal walls – 70 x 45mm
— Use full sheets where possible
— If part sheets are required a minimum dimension of 300mm applies for all bracing elements
— All joints and fastener heads in GIB EzyBrace® Systems must be stopped. GIB® tape must be used in joints

Bracing in Wet Areas
GIB EzyBrace® Systems are not to be installed inside shower cubicles or around baths.
Outside of these areas it is acceptable to use GIB EzyBrace® Systems in bathrooms and other wet areas provided that the surface of the element is maintained impervious for the life of the building.

Small Openings in Bracing Elements
Small openings (e.g. power outlets) of 90 x 90mm maximum or circular holes no more than 100mm may be placed no closer than 90mm to the edge of the braced element. A block may need to be provided alongside the perimeter stud as shown below.

Large Openings in Bracing Elements
For openings above 90 x 90mm such as switch boards, recessed cabinets and TV’s etc. should be placed outside of the bracing element or locate the bracing element on the other side of the wall framing.

Intersecting Walls
GIB® Bracing Elements may have intersecting walls with a minimum length of 200mm. Fasteners are required around the perimeter of the bracing element. Vertical joints at T-junctions shall be fixed and jointed as specified for intermediate sheet joints. The bracing element length must be no less than 900mm.

When fixing part sheets of GIB® plasterboard to the side of a T-junction, a minimum width of 300mm applies for bracing elements. See figures on p. 67.
Intersecting Walls

Example using fastener pattern for GS and BL elements

Top Plate Connections

For top plate connection refer to NZS3604:2011 section 8.7.3.

Parapets and Gable End Walls

Bracing elements must be fixed from top plate to bottom plate. Fixing to a row of nogs is not acceptable unless either:

A continuous member such as an 90 x 45mm ribbon plate is fixed across the studs just above a row of nogs at the ceiling line;

OR

GIBFix® Angle is installed as shown. The angle is fixed to a row of nogs with 30 x 2.5mm galvanised flat head nails at 300mm centres.

Screw and Adhesive Fix for Openings - GS2-NOM Only

Use a continuous 6-10mm bead of GIBFix® All-Bond on studs immediately adjacent to openings.
5.1.8 Ceiling Diaphragms

Ceiling diaphragms do not have a bracing unit rating but are used when bracing lines are spaced further than 6.0m apart.

Any 10mm or 13mm GIB® plasterboard can be used for ceiling diaphragms.

### Ceiling Diaphragms

**Small Openings**
Small opening (e.g. down lights) of 90 x 90mm or less may be placed no closer than 90mm to the edge of the ceiling diaphragm.

**Large Openings**
Openings are allowed within the middle third of the diaphragms length and width. Fixing of sheet material to opening trimmers shall be at 150mm centres. Neither opening dimension shall exceed a third of the diaphragm width. Larger openings or openings in other locations require specific engineering design.

Where fireplace flue or range hood openings are required in a ceiling diaphragm the use of a galvanised metal backing plate is recommended, with a maximum hole diameter of 350mm.

Use full width sheets where possible.

Minimum length sheet – 1.8m
Minimum width sheet – 900mm

Sheets less than 900mm in width but no less than 600mm may be used provided that the sheet edge joint is fully back blocked.

Ceiling diaphragms may be constructed using any GIB® plasterboard provided perimeter fixing is at:

- 150mm centres for: Diaphragms up to 7.5m in length, no steeper than 15°.
- 100mm centres for: Diaphragms up to 7.5m in length, no steeper than 45°. Diaphragms up to 12m in length, no steeper than 25°.

Diaphragms outside these parameters must be specifically designed.

*Perimeter centres at 150mm or 100mm depending on diaphragm limitations

All fastener spacings are maximums.
### Ceiling Diaphragms

**GIB® Rondo® 310 metal ceiling battens** may be used if fixed directly through the flanges into the ceiling framing using 2/32mm x 8g wafer head screws.

If the 310 ceiling battens are required to be clip fixed, a block or continuous timber member must be securely attached to the ceiling framing at the level of the back of the metal batten. The batten is then fastened to this timber as shown.

For steel battens, a continuous channel or angle is required to the perimeter of the diaphragm.

This shall be fastened to the framing with GIB® Grabber® 32mm x 8g wafer head screws at 300mm centres.

**Battens shall be fixed to the channel with 32 x 8g GIB® Grabber® wafer head screws.**

It is important that a positive connection is created between the top plate and the ceiling substrate.

Coved ceiling diaphragms can be achieved by attaching a folded metal angle to the junctions.

- Minimum .55mm BMT with 100mm each leg
- Fastened at 300mm centres on each edge using 32mm x 6g GIB® wafer head screws

Linings shall be fixed to both sides of the metal angle at 150mm or 100mm centres with minimum 25mm x 6g GIB® Grabber® self-tapping screws

---

**General installation**

- Sheet end butt joints must be formed off framing and back-blocked (see p. 47)
- Framing and ceiling batten requirements for ceiling diaphragms are the same as for general ceiling installation (see p. 45)
- The body of the ceiling shall be fixed as per general ceiling installation (see p. 45)
- Openings and penetrations in ceiling diaphragms are as for wall bracing (see p. 66)
- Linings shall be installed over the entire area of the diaphragm
- Joints and fastener heads must be stopped. GIB® tape must be used in joints
5.2 GIB AQUALINE® WET AREA SYSTEMS

This section covers the installation of GIB Aqualine® Wet Area Systems. Full information can be found in the GIB Aqualine® Wet Area Systems literature.

GIB Aqualine®

GIB Aqualine®, with its green face paper, has a water resistant core which will provide resistance to the effects of moisture in wet areas such as bathrooms and laundries.

Although able to cope with infrequent short-term exposure, standard gypsum plasterboard will have a shortened life expectancy when frequently exposed to water or moisture.

The NZBC does not call for water resistant linings in wet areas but it is highly desirable to incorporate lining materials which will maintain their integrity longer when exposed more frequently to water or steam and particularly to one-off events such as leakages or flooding of a room.

Limitations

— Do not use GIB Aqualine® in situations where it is exposed for extended periods to humidities of 90% RH or greater. Such areas include group shower rooms, as well as moisture and chlorine laden environments such as indoor heated swimming pools
— GIB Aqualine® must not be installed in exterior situations
— GIB Aqualine® must not be directly applied to solid plaster (gypsum or cement) wood based sheet linings or similar materials, masonry or concrete. GIB Aqualine® may only be applied to these materials where timber strapping or steel furring channels are installed
— GIB Aqualine® must not be installed over a vapour barrier or a wall acting as a vapour barrier
— GIB Aqualine® must not be used for bracing purposes in shower cubicles or over baths

NZBC Clauses E3 Internal Moisture

E3.3.4 requires impervious and easily cleaned surfaces to all surfaces adjacent to sanitary fixtures or laundering facilities.

E3.3.5 requires that surfaces of building elements likely to be splashed or contaminated in the course of the intended use of the building, must also be impervious and easily cleaned.

E3.3.6 requires that surfaces of building elements likely to be splashed must be constructed in a way that prevents water from penetrating behind linings or into concealed spaces (e.g. wall cavities).

Walls in wet areas therefore need to be addressed according to whether they fall within the scope of one of the following descriptions:

1. Wall surface likely to be splashed
2. Wall surfaces directly exposed to water e.g. shower walls

Although not a requirement of NZBC it is highly recommended that the wall surfaces within 150mm of the top edge of a bath, and the vertical faces immediately under the edge of a bath, are treated in the same way as for a shower wall.
5.2.1 Surface in Showers and Around Baths

A waterproof membrane complying with AS/NZS 4858 MUST be applied to all lining materials used under ceramic tiles in these areas.

The waterproof membrane must extend to a 1500mm horizontal radius from a shower rose unless the shower is contained within a fixed enclosure. A shower curtain does not constitute a fixed enclosure.

Particleboard flooring manufacturers recommend that in wet areas, panels should be protected with a suitable wet area membrane or an integrally waterproof sheet material. Some local authorities call for this treatment on all timber based floors. Local requirements should be checked before proceeding.

Dark grey shaded areas in the diagrams below represent the minimum extent of wall surfaces requiring impervious sheet materials or waterproof membranes prior to tiling. Light grey shaded areas represent best practice.
5.2.2 Fixing Details for Non Tiled Walls

As for general installation details (see p. 38–41)

Ceilings
Battens or ceiling joists shall be spaced at 450mm centres maximum for 10mm GIB Aqualine® and 600mm centres maximum for 13mm GIB Aqualine®.

Ceiling Fixing
Fixing as for GIB® Standard plasterboard (see p. 45)

Jointing
All sheet joints must be GIB® tape reinforced and stopped in accordance with instructions on p. 83.

5.2.3 Fixing Details for Tiled Walls

Wall Framing
Timber Framing dimensions and spacings must comply with the requirements of NZS 3604:2011.

Prior to lining in tiled areas (shower cubicles and shower over bath only) the internal corners shall be reinforced with a minimum 32mm x 32mm angle such as NZ18 or GIBFix® Angle. Each side of the angle shall be fastened to the framing with 30mm galvanised clouts at 300mm centres (see p. 74).

Steel stud systems are proprietary but do not generally incorporate nogs except as required below:

- Adjacent to each pipe penetration and behind sink and tub flashings
- Between all studs above bath flanges and preformed shower bases
- To support towel rails, grab rails and wall basin brackets
- For impact protection in shower cubicles or shower over bath situations it is important that all sheet joints are made on solid blocking. This may either require vertical fixing of the GIB Aqualine® or the installation of some additional nogs

Lining and Tile Weights

- 10mm or 13mm GIB Aqualine® is recommended for use on timber or steel framing and for tile weights up to 20kg/m²
- 13mm GIB Aqualine® must be used for tile weights between 20 and 32kg/m² and when steel framing has been used

- GIB® Grabber® Drywall Screws at 100mm centres to perimeter of tiled wall and to all intermediate studs
- For 10mm GIB Aqualine® use minimum 25mm x 6g GIB® Grabber® Drywall Screws
- For 13mm GIB Aqualine® use minimum 32mm x 6g GIB® Grabber® Drywall Screws
- GIB Aqualine® may be fixed vertically or horizontally
- Provide a 5mm–10mm gap at the wall/floor junction
- Provide a 5mm–10mm gap between the bottom edge of the GIB Aqualine® and any bath rim or preformed shower base to allow for placement of sealant
- GIB Aqualine® sheets shall be touch fitted
- Where the framing or fastener centres required for tiled GIB Aqualine® are closer than those specified for GIB® Fire Rated and GIB Noise Control® Systems, the GIB Aqualine® specification shall prevail. Where relevant check fastener lengths comply with requirements of GIB® Fire Rated Systems
- Do not fix tiles to GIB® plasterboard ceilings or non-vertical planes

Jointing

- Jointing shall be carried out in accordance with instructions on p. 85
- No joint compound is required under impervious shower linings
- Air drying compounds shall not be used on areas that are to be tiled

Fastening the Linings – Horizontal Fixing in Tiled Areas

<table>
<thead>
<tr>
<th>Option A</th>
<th>Option B</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single screw to each stud where the horizontal joint crosses the studs</td>
<td>Screws as specified 100mm centres</td>
</tr>
<tr>
<td>5–10mm gap between edge of sheet and floor</td>
<td>Adhesive is not to be used in place of mechanical fastenings</td>
</tr>
<tr>
<td>Note: Nog required behind all joints in showers or shower over bath situation</td>
<td></td>
</tr>
</tbody>
</table>

OPTION A

OPTION B
5.2.4 Tiling, Flexible Sheet Vinyl and Rigid Sheet Shower Linings

**Tiling**
- Tile grouting and sealing shall be carried out in accordance with the requirements of AS3958.1:2007 (Guide to the Installation of Ceramic Tiles)
- Provide for surface control joints at 4m centres maximum
- The adhesive shall be organic based complying with AS2358 – 1990 (Adhesives for Fixing Ceramic Tiles)
- Note that the adhesive should be combed in a horizontal direction only. It is important that adhesive is applied to the wall and not “buttered” onto individual tiles

**Flexible Sheet Vinyl – Showers and Other Wet Areas**
- GIB Aqualine® is a suitable substrate for flexible vinyl wall finishes in wet areas of residential, commercial or institutional buildings
- Framing requirements and installation procedures for the GIB Aqualine® substrate shall be as per p. 72, except that the lining gap at the floor is reduced to 5mm when a pencil cove detail is used
- The installation of metal reinforcing angles (minimum. 32 x 32 x 0.55mm) behind internal GIB Aqualine® corners is recommended for sheet vinyl applications in showers or shower over bath situations (see illustration p. 74)
- The GIB Aqualine® lining must be jointed and stopped to a paint quality finish (Level 4) – trowel marks can telegraph through even a commercial grade 2mm vinyl
- A minimum vinyl thickness of 2mm is recommended for the wall finish in commercial or institutional bathrooms and showers
- In areas directly exposed to liquid water, all joints in flexible sheet vinyl must be heat welded
- Installation of the flexible vinyl must be carried out strictly in accordance with the specifications provided by the suppliers/ manufacturers of the vinyl

**Rigid Sheet Shower Linings**
- The manufacturers/suppliers of thin (usually 2mm–3mm) and rigid acrylic shower linings commonly recommend direct adhesive fixing to wall linings using solvent-based adhesives
- Do not pre-seal areas which are to be covered by the rigid shower linings
- Some suppliers of rigid sheet acrylic shower linings recommend a minimum of one week for the adhesive to cure fully prior to use
- Water temperature changes will cause movement of the thin acrylic sheet, which in turn will stress the adhesive and wall lining substrate
- Care must be taken to ensure that rooms are adequately ventilated and the adhesive is fully cured before the shower is used
- Consult the manufacturer/supplier of the shower lining for full installation details

**Waterproof Membranes (tilled shower areas and shower over baths)**
- In showers and shower over bath situations the GIB Aqualine® system is not complete and ready for tiling until coated with a waterproof membrane over the lining and the jointed areas
- Only in-situ waterproofing materials which are manufactured to AS/NZS 4858:2004 Wet Area Membranes Requirements are recommended.
- Waterproof membranes must be fully cured and dry prior to application of tiling adhesives
- Embed reinforcing mats in the membrane at all internal corners of the shower (including floor/wall junctions)

For further information on waterproof membranes prior to tiling, consult BRANZ GOOD PRACTICE GUIDE TILING.
5.2.5 Typical Construction Details

FIG. B: Typical Details for Tiled Shower over Bath

Outlined area (to be tiled) must be coated with an approved waterproof membrane. Alternatively, if the shower box is finished with flexible sheet vinyl, the vinyl must also extend to the outlined area.

GIB® jointing tape in GIB® Tradeset compound (no topcoats required under impervious linings)

Solid fixing behind plasterboard joint in shower area only

Reinforced mat embedded in waterproof membrane

Sealant around pipe penetrations

GIB Aqualine®

NB: Apply sealant to junction between wall and impervious lining

Waterproof membrane to edge of bath if shower screen is fitted. Otherwise 1500mm from shower rose

Sealant along bath lip/joint

Reinforcing mat embedded in waterproof membrane applied to floor and returned up the wall to a minimum of 150mm prior to screed by tilers

Masking tape

Foam backing rod

32 x 32 x 0.55mm metal angle e.g. NZ18 or GIBFix® Angle to min. height of 1800mm

32 x 32 x 0.55mm metal angle e.g. NZ18 or GIBFix® Angle to min. height of 1800mm

NB: Apply sealant to junction between wall and impervious lining

As the edge profiles of showers and baths can vary significantly between manufacturers, these details are intended only as a guide. Attention should be paid to ensure that:

— Sufficient sealant to effect a waterproof barrier has been used
— The sealant has been applied in a manner that does not permit water ingress

Note: The gap between the front face of the shower/bath upstand and the front face of the GIB Aqualine® should be 1mm–4mm. This may require additional packing behind final layer of GIB Aqualine® OR checking shower tray or bath into framing.

Silicone sealants must be of the mould inhibiting type and must be compatible with GIB Aqualine®, shower/bath surfaces and the impervious lining.

FIG. D: Typical shower edge detail

5–10mm

GIB Aqualine®
Waterproof Membrane required prior to tiling
Impervious Lining
Sealant
Proprietary Shower Tray

FIG. E: Typical shower edge detail in fire or noise control area

5–10mm

GIB® plasterboard, number of sheets, thicknesses and installation to be as per specified GIB® system
GIB Aqualine®
Waterproof Membrane required prior to tiling
Impervious Lining
Sealant
Proprietary Shower Tray

FIG. F: Typical bath edge detail

5–10mm

GIB Aqualine®
Waterproof Membrane required prior to tiling
Impervious Lining
Sealant
Proprietary Bath

FIG. G: Typical bath edge detail in fire or noise control area

5–10mm

GIB® plasterboard, number of sheets, thicknesses and installation to be as per specified GIB® system
GIB Aqualine®
Waterproof Membrane required prior to tiling
Impervious Lining
Sealant
Proprietary Bath
5.2.5 Typical Construction Details

It is recommended that GIB Aqualine® is fixed to ceilings in wet areas such as bathrooms and laundries. Installation is the same as for standard ceiling. See p. 45.

**FIG. H: Typical Plumbing Penetration**

Penetrations in wet areas should be sealed with silicon sealant to prevent moisture access to the framing.

**FIG. I: Sealing Under Mixer Facia**

Apply a bead of sealant behind the cover plate on shower mixer to divert any water from the penetration.

**FIG. J: Tiled Shower – Internal Corner Detail**

Edge profiles of baths and shower trays can vary significantly between manufacturers. Always follow the manufacturers installation instructions.

The details shown are intended as a guide only.

Allow 5mm–10mm gap between bath rim and/or shower base to allow for installation of sealant.

Sealants should contain a mould inhibitor.

Ensure that the gap is well filled with sealant.
5.3 GIB® FIRE, NOISE AND OTHER PERFORMANCE SYSTEMS

Because of the volume of information it is not feasible to include installation guidance for all the GIB® Performance Systems in the GIB® Site Guide. If you are installing GIB® Performance Systems including GIB® Fire, Noise, Tough or Intertenancy systems it is strongly recommended that you obtain a copy of the relevant specification and installation publication prior to commencing installation.

These can be easily accessed by:
— Download from gib.co.nz
— Download the GIB® App available free from the App or Google Play Stores
— Contact the GIB® Helpline on 0800 100 442
— Or from most GIB® plasterboard stockists

5.3.1 GIB® Fire Rated Systems

The NZBC requires fire safety systems to reduce the risk of injury or death, and to protect adjacent property in a fire situation.

Fire rated systems require attention to the details in the GIB® Fire Rated Systems literature.

Deviating from these specifications can invalidate the system leading to expensive remedial work to comply or increased risk in case of fire.

A fire system is NOT simply a matter of fixing GIB Fyreline® instead of another GIB® plasterboard.

The fire resistance rating can only be assured when the board has been installed strictly in accordance with the relevant instructions in the GIB® Fire Rated Systems literature.

5.3.2 GIB Noise Control® Systems

Noise control for Intertenancy situations is comprehensively covered in GIB Noise Control® Systems literature. As these situations are generally subject to building code requirements it is important that the publication is consulted to design and construct Intertenancy noise control systems.

Sound Transmission Class (STC)

STC relates to airborne noise such as speech, TV and so on. It is the ability of a wall, ceiling, or floor/ceiling to reduce noise from rooms next door. In general a higher STC means a better performance.

STC 35 – Normal speech may be clearly heard in the next room

STC 45 – Muffled speech may be heard in the next room

STC 55 – Minimum building code requirement for intertenancy walls

Impact Insulation Class (IIC)

IIC measures the ability of a floor or ceiling system to reduce noise resulting from impacts such as footsteps, falling objects and moving furniture. A higher IIC means a better performance. Impact noises easily travel from hard surfaces into the structure and to the room below. Hard surfaces such as finished timber floors and ceramic tiles often cause noise transmission to the room below. Semi-hard surfaces such as cork tiles and flooring grade vinyl perform a little better, but still do not efficiently absorb impact energy. Installing carpet and underlay is an effective way of reducing impact noise. Installing a GIB Noise Control® System will help reduce impact and airborne noise levels.

Substitution

GIB Noise Control® Systems are not generic. It is important that only GIB® branded components are used when specifying and installing GIB Noise Control® Systems. Substitution is not in accordance with GIB® Systems recommendations and is at the risk of the owner, specifier or builder.
